The Role of Training Deep Learning on Metadata to Diagnose Artificial Intelligence (AI) Psychosis Patients

You are invited to participate in a research study titled:

The Role of Training Deep Learning on Metadata to Diagnose Artificial Intelligence (AI) Psychosis Patients

- This study is being done by Andrew Yoon from O.D. Tompkins High School as a requirement of the College Board Capstone – AP Research class.
- You were selected to participate in this study because your presence in an AI psychosis support circle suggests you have had an experience related to the condition and that you have since recovered enough to discuss it comfortably.

PURPOSE OF STUDY:

- You are invited to take part in a research study. Before you decide to participate in this study, it is important that you understand why the research is being done and what it will involve. Please read the following information carefully. Please ask the researcher if there is anything that is not clear or if you need more information.
- The purpose of this study is to investigate how the times at which messages to AI can give valuable context to whether someone has AI psychosis. With artificial intelligence (AI) companies producing smarter models with inadequate safeguards, it becomes necessary to stop AI psychosis in advance. Existing research has been taken to examine conversations for psychosis, but there is a distinct lack of research into how we can use alternative forms of data instead of the messages themselves. This approach minimizes privacy invasions to the people being analyzed.

STUDY PROCEDURES:

The purpose of this research study is to produce an artificial intelligence powered solution to detect erratic behavior when people are interacting with AI models to flag people at risk of developing AI psychosis.

- If you agree to take part in this study, you will be asked to export some of your conversation data from AI softwares like ChatGPT, Claude, or Gemini to share with the researcher. The message content will be erased so that even the researcher is unaware of the conversation's potentially sensitive information. For each message, the participant will rate how much they felt the message exhibited symptoms of AI psychosis on a scale of 1 to 5, with 5 demonstrating the most symptomatic behavior and 1 being closest to a typical conversation. These ratings, along with the timestamps of each message, will be disclosed to the researcher but remain confidential to the public. Overall trends about the data may be published, but the participant's individual statistics will not.
- This survey will ask about potentially sensitive topics such as the participant's medical history, especially regarding AI psychosis.
- The process will take you approximately 30 minutes to complete. There will be an optional decision to opt into an interview portion, during which you will be asked about your experiences about AI psychosis in order to determine other suitable methods to detect AI psychosis while protecting users' privacy.

Participant's Initials: _____

- Should you opt into the interview portion, it will be audio-taped in order to ensure that all quotes and comments are not misrepresented in any way with the participant's permission.

RISKS:

- Some of the survey questions ask about your mental health as you were experiencing AI psychosis and may be distressing to you as you think about your experiences.

BENEFITS:

- There will be no direct benefit to you for your participation in this study.
- However, we hope that the information obtained from this study will help diagnose or save others from experiencing similar symptoms of AI psychosis.

CONFIDENTIALITY:

- Your responses to the survey where you share your conversation with an AI will be anonymous. This will be done by doing the following:
    - Removing all English (or other human language) words from the conversation data, leaving just the timestamps.
- However, the optional interview portion of this study will not be anonymous. Should you choose to opt in, every effort will be made by the researcher to preserve your confidentiality including the following:
    - Assigning code names/numbers for participants that will be used on all research notes and documents
    - Summarizing and anonymizing notes, interview transcriptions, and any other identifying participant information in an electronic digest
    - Destroying all confidential data/documents, including audio tapes, at the culmination of this project
- Participant data will be kept confidential except in cases where the researcher is legally obligated to report specific incidents. These incidents include, but may not be limited to, incidents of abuse and suicide risk.

COMPENSATION:

- No compensation will be given for participation in this study.

CONTACT INFORMATION:

- If you have questions at any time about the study or the procedures, you may contact my AP Research teacher, Dr. John Gresham via email at JohnDGresham@katyisd.org.
- If you feel you have not been treated according to the descriptions in this form, or that your rights as a participant in research have not been honored during the course of this project, or you have any questions, concerns, or complaints that you wish to address to someone other than the investigator, you may contact the Tompkins Campus IRB, Attn: Mr. Scott Shanks, at 4400 Falcon Landing Blvd, Katy, TX 77494

VOLUNTARY PARTICIPATION:

Participant's Initials: _____

Informed Consent

The Role of Training Deep Learning on Metadata to Diagnose Artificial Intelligence (AI) Psychosis Patients

Your participation in this study is voluntary. It is up to you to decide whether or not to take part in this study. If you decide to take part in this study, you will be asked to sign a consent form. After you sign the consent form, you are still free to withdraw at any time and without giving a reason. Withdrawing from this study will not affect the relationship you have, if any, with the researcher. If you withdraw from the study before data collection is completed, your data will be returned to you or destroyed.

CONSENT:

I have read and I understand the provided information and have had the opportunity to ask questions. I understand that my participation is voluntary and that I am free to withdraw at any time, without giving a reason and without cost. I understand that I will be given a copy of this consent form. I voluntarily agree to take part in this study.
